

PocketSmart – Ensure Modular Code Structure

Member Assignment – Vakitha Begam N (Team Lead)

1. Topic

Ensuring a modular code structure for PocketSmart

Epic: 2 – Core Functionalities Development

2. Project Overview

PocketSmart is an AI-powered app that helps users track spending, set budgets, and get personalized money-saving suggestions. As the core features are built, the code must be organized into separate modules so the team can develop, test, and update each feature without breaking the others.

3. Objective

To organize the PocketSmart code into clear, independent modules, such as expense tracking, budgeting, AI insights, and database handling, so the project is easy to build, test, maintain, and expand.

4. Work Steps

- 1 Plan the core features and decide which module each feature belongs to.
- 2 Create a clear project folder structure with separate folders for each module.
- 3 Build separate modules for expense tracking, budget management, and AI insights.
- 4 Keep database handling and Gemini API calls in their own separate files.
- 5 Move shared helper functions and settings into common utility and config files.
- 6 Make sure each module has one clear purpose and does not repeat code from another module.
- 7 Add comments and short documentation for each module so team members can understand it.
- 8 Test each module on its own, then test all modules working together.

5. Main Parts of the Code Structure

- Project folder structure
- Expense tracking module
- Budget management module
- AI insights module (Gemini integration)
- Database and configuration files
- Utility functions and documentation
