

PocketSmart – Topic Links and Prerequisites

(Project Setup Reference)

Member Assignment – Vakitha Begam N (Team Lead)

1. Topic

Reference links and prerequisites needed before starting development of PocketSmart

Epic: Project Preparation and Gemini AI Initialization

2. Project Overview

PocketSmart is an AI-powered app that helps users track spending, set budgets, and get personalized money-saving suggestions. It uses Google Gemini AI to analyze spending data and generate insights. Every team member must complete the prerequisites below and use the reference links so the whole team works on the same setup.

3. Objective

To list everything the team must have ready (accounts, tools, and knowledge) and to collect the official topic links the team will refer to while building PocketSmart, so that setup is smooth and consistent for all members.

4. Prerequisites

No.	Prerequisite	Purpose
1	Google account	Sign in to Google Cloud and Google AI Studio
2	Google Cloud project (PocketSmart)	Holds the Gemini API and API key
3	Billing set up (if required)	Needed only if the project requires paid usage
4	Gemini API key	Lets the backend call Gemini AI
5	Python 3.9 or above and pip	Backend language and package manager
6	Google Gemini Python library	Connects the backend to Gemini
7	python-dotenv library	Loads the API key from the .env file
8	Code editor (VS Code)	Writing and running the code
9	Git and a GitHub account	Team code sharing and version control
10	Basic knowledge of Python, REST APIs, and environment variables	Needed to build and test the backend

5. Topic Links

Topic	Link
Google Cloud Console	https://console.cloud.google.com
Google AI Studio (get API key)	https://aistudio.google.com/app/apikey

Topic	Link
Gemini API documentation	https://ai.google.dev/gemini-api/docs
Gemini API quickstart	https://ai.google.dev/gemini-api/docs/quickstart
Gemini API key guide	https://ai.google.dev/gemini-api/docs/api-key
Rate limits and quotas	https://ai.google.dev/gemini-api/docs/rate-limits
Google Cloud API Library	https://console.cloud.google.com/apis/library
Python download	https://www.python.org/downloads/
python-dotenv (PyPI)	https://pypi.org/project/python-dotenv/
Visual Studio Code	https://code.visualstudio.com/
Git download	https://git-scm.com/downloads
GitHub	https://github.com

6. Work Steps

1. Confirm every team member has a Google account and a GitHub account.
2. Install Python, pip, Git, and VS Code on each member's system.
3. Create the PocketSmart project in Google Cloud and enable the Gemini API.
4. Generate the API key and restrict it to the Gemini API only.
5. Create a .env file for the API key and add it to .gitignore so it is never uploaded to GitHub.
6. Install the required libraries: pip install google-generativeai python-dotenv
7. Read the Gemini quickstart and rate-limit pages using the topic links above.
8. Run a test prompt to confirm every member's setup works, then report the status to the team lead.

7. Main Parts of the Preparation

- Account and tool prerequisites
- Official topic and documentation links
- Secure API key handling (.env and .gitignore)
- Library installation and environment setup
- Team verification and status reporting

8. Team Lead Responsibilities

- Share this document and the topic links with all team members
- Check that each member completes the prerequisites
- Make sure no API key is uploaded to GitHub
- Collect setup status and resolve blockers

Note: Links and package names are current at the time of writing; please confirm them on the official pages.
