

Pocket Smart AI

Modular Architecture Setup

Team Member Assignment – Pushra N

1. Topic

Modular Architecture Setup

Epic: Modular Architecture Setup

2. Project Overview

Pocket Smart AI is an AI-powered application designed using a modular architecture. The application is divided into separate modules for configuration, routes, services, database, AI functions, and utilities. This structure makes the system easier to develop, test, maintain, and extend.

3. Objective

To design and set up a clean modular architecture for Pocket Smart AI by separating different responsibilities into independent and reusable modules.

4. Work Steps

- 1 Create the main Pocket Smart AI project folder and define the required module structure.
- 2 Create separate packages for routes, services, models, configuration, and utilities.
- 3 Set up the application configuration and environment variables.
- 4 Organize database models and database connection logic into a dedicated module.
- 5 Create service modules for the application's core business logic and AI functionality.
- 6 Connect the route/API modules with the appropriate service modules.
- 7 Add validation, utility functions, and centralized error handling.
- 8 Test the modules individually and verify that the complete application works together.

5. Main Modules

- Configuration module – manages application settings and environment variables.
- Routes/API module – handles user requests and API endpoints.
- Services module – contains the main business logic and AI operations.
- Database module – manages models and database operations.
- Utilities module – provides reusable helper and validation functions.
- Error handling – manages application errors and clear responses.

6. Expected Outcome

A well-organized and working modular architecture for Pocket Smart AI in which each module has a clear responsibility and can be developed, tested, and maintained independently.
