

PocketSmart – Login and Register Page Routes (Core Functionalities Development)

Member Assignment – Ihsaana

1. Topic

Writing the login and register page routes

Epic: Core Functionalities Development

2. Project Overview

PocketSmart is an AI-powered app that helps users track spending, set budgets, and get personalized money-saving suggestions. Each user needs a personal account so that their expenses, budgets, and insights stay private and secure.

3. Objective

To write the routes for the login and register pages so that new users can create an account, existing users can sign in safely, and only logged-in users can reach their dashboard.

4. Work Steps

- 1 Create the register and login page templates using Jinja2.
- 2 Define the GET route for the register page that displays the sign-up form.
- 3 Define the POST route for registration that receives the name, email, and password from the form.
- 4 Validate the input, check that the email is not already registered, and confirm that the password is strong enough.
- 5 Hash the password before saving it and store the new user in the SQLite database.
- 6 Define the GET route for the login page that displays the sign-in form.
- 7 Define the POST route for login that checks the email and verifies the password against the stored hash.
- 8 Create a session or token after a successful login and redirect the user to the dashboard.
- 9 Add a logout route that ends the session and returns the user to the login page.
- 10 Add error handling to show clear messages such as email already exists or invalid email or password, then test the complete flow.

5. Main Parts of the Login and Register Routes

- Register and login page templates
- Register route (GET and POST)
- Login route (GET and POST)

- Input validation and password hashing
- Session or token handling and logout
- Error messages and testing
